

Personal Website Project Reflection

For this assignment, I created a personal website using HTML and CSS consisting of five main pages: **Home**, **About Me**, **CV**, **Gallery**, and **Contact**. Each page has its own structure and design but maintains a consistent navigation bar at the top for easy access between pages.

The **Home page (index.html)** welcomes visitors and provides a brief introduction about me, with links to the other sections. The **About page (about.html)** gives more details about who I am and highlights my interests, such as cooking, learning programming, and watching movies. The **CV page (cv.html)** presents my educational background and experience in a clear and organized layout using lists and section headings. The **Gallery page (gallery.html)** displays a selection of my favorite photos, neatly arranged using image tags within a section element. Finally, the **Contact page (contact.html)** includes a simple form where users can fill in their name, email, and message to get in touch with me.

Each HTML file is connected to its own CSS file for styling, ensuring visual consistency and an appealing layout across all pages. This project helped me understand how to structure a multi-page website, connect different sections, and use forms, lists, and navigation effectively. It also strengthened my skills in HTML and CSS, as well as my understanding of website organization and design principles.
